Summary

Computer Engineering student based in Lisbon with a strong passion for software development, problem solving, and building real-world applications. Focused on full-stack development, system design, and understanding low-level computing concepts. Highly motivated to grow in the fields of Artificial Intelligence and Cybersecurity, with hands-on experience across backend systems, web applications, mobile development and AI frameworks.

Education

Instituto Superior de Engenharia de Lisboa (ISEL)

Sept 2023 – present

Bachelor of Engineering - Computer Science

- Final-year student planning to pursue a Master's degree in Computer Engineering with specialization in Artificial Intelligence and Cybersecurity.

Skills

Programming Languages: Kotlin, JavaScript, Python, C, Assembly, HTML, CSS, TypeScript.

Web & Frameworks: Spring Boot, React, FastApi, LangChain, Node.js, Express, http4k, Jakarta, JPA

Databases & DevOps: PostgreSQL, MongoDB, JDBC, JDBI, ChromaDB, Docker, Nginx

Mobile & Tools: Jetpack Compose, Android Studio, Render, ngrok

Projects

EvoLab-as-a-Service

Lisbon, Portugal
2026

- Final-year capstone project: web platform to integrate the openEvolve library, built with Kotlin and Spring Boot for the backend and React with TypeScript for the frontend.
- User requests are persisted in a queue so workloads are processed asynchronously and reliably under concurrent usage.
- A worker pool consumes queued jobs, orchestrates execution, and launches containerized openEvolve runs.
- Integrates OAuth 2.0 and OpenID for secure authentication, Dockerized services, and PostgreSQL for relational data storage.

EvoLab Chatbot

Lisbon, Portugal
2026

- Built an AI chatbot for the EvoLab final-year project using Python, FastAPI, and the LangChain framework to expose conversational endpoints.
- Implemented a Retrieval-Augmented Generation (RAG) pipeline backed by ChromaDB, enabling the assistant to answer questions using project documents stored in a vector database.
- Developed a lightweight frontend integration with JavaScript, HTML, and CSS, using an Immediately Invoked Function Expression (IIFE) to generate the chatbot UI dynamically.
- Designed the frontend script to be embedded directly in the EvoLab application, sending requests to the local FastAPI service.

Poker Dice Web

Lisbon, Portugal
2025

- Multiplayer web-based game built with a Spring Boot (MVC) backend exposing a REST API and a React frontend with SSE events.
- Fully containerized using Docker and served through Nginx, following a clean full-stack architecture and supporting multiplayer gameplay logic.

Veridict AI

Lisbon, Portugal
2026

- Advanced security analysis engine to detect phishing links, malicious text, and smishing attempts in real-time.
- Implemented a 3-tier evaluation system (Rules Engine, Reputation Service, and AI Engine) to compute a weighted risk score and classify security threats.
- Integrated Google Safe Browsing API, DNS resolution checks, and WHOIS domain age lookups for live threat verification.
- Utilized local LLMs (via Ollama) paired with a ChromaDB RAG vector store to semantically evaluate text and generate contextual explanations for users.

Poker Dice Android

Lisbon, Portugal
2025

- Native Android version of the Poker Dice game developed using Kotlin and Jetpack Compose.
- Implements a modern declarative UI, supports multiplayer sessions, and follows clean architecture principles for maintainability and scalability.
- Uses SSE for real-time updates and integrates with the backend API for game logic and state management.
